De trillingen in de geplande gebouwen dienen als volgt te worden berekend:

1. Op basis van het hieronder gegeven trillingsspectrum op maaiveld dient de maatgevende trillingssterkte V_{max} in de gebouwen te worden berekend¹.

Frequentie [Hz]	X-richting [mm/s, ongewogen]	Y-richting [mm/s, ongewogen]	Z-richting [mm/s, ongewogen]

79.4	0.019	0.053	0.027

2. De gemiddelde trillingssterkte V_{per} dient vervolgens indicatief als volgt te worden berekend:
 - a. Voor 3 concerten (in 2023 en 2024) is op maaiveld de trillingssterkte V_{max} per 30 seconden vastgesteld. In onderstaande tabellen is per 30 seconden voor de X-, Y- en Z-richting aangegeven hoe hoog de $V_{max,i}$ (i is hier de richting, dus X, Y of Z) in de betreffende 30 seconden is als functie van de maximale $V_{max,i}$ voor die richting over alle concerten en 30-secondeperioden heen.
 - b. De in de tabellen benoemde percentages dienen te worden vermenigvuldigd met de in het gebouw berekende trillingssterkte per richting (X, Y of Z).

¹ De tertsbandfrequenties bij 2.5 en 3.2 Hz zijn afkomstig van evenementen in het Gelredome, de trillingen bij de overige frequenties zijn omgevingstrillingen (zoals van verkeer in de huidige situatie). In de berekeningen dient hiermee rekening te worden gehouden.

- c. Vervolgens dient de maximale gemiddelde trillingssterkte V_{per} te worden vastgesteld per richting en per concert.
- d. De te toetsen gemiddelde trillingssterkte V_{per} is het maximum over alle richtingen en over alle concerten heen.
