Windloading
Values for the 'Standard Normal Dynamic Pressure' have been derived from French standards - 'The Effects of Snow & Wind on Structures Regulations NV65-67 & N84 (Wind Region 3, extreme, ground level up to 10m, q_s = 1607N/m²). These values have then been used according to Eurocode 1991-1-4 Actions on Structures: Wind Loading/BS 6399, Part 2:1997 - 'Loading for Buildings (code of practice for wind loads)' to calculate the loads imposed. Eurocode appears to offer a 5% reduction in load on average over BS6399. At present we advise the use of the Standard providing the highest loadings in order to cater for worst case scenarios.
