- 3 Resultaten

## 1 Inleiding

In opdracht van AM, Bouwfonds en Lekstede Wonen heeft Advies- en ingenieursbureau Oranjewoud een onderzoek uitgevoerd waarmee de concentraties luchtverontreinigende stoffen zijn onderzocht, in beeld zijn gebracht en zijn beoordeeld. Dit onderzoek is uitgevoerd in het kader van de ruimtelijke planprocedure voor het project Hoef en Haag in Vianen.

Doel van het plan is de realisering van woningbouwlocatie Hoef en Haag met op termijn circa 1.800 woningen mogelijk te maken. Echter is in de Provinciale Ruimtelijke Structuurvisie opgenomen dat in de periode tot 2028 binnen Hoef en Haag in totaal 1.500 woningen kunnen worden gebouwd en geldt voor het bestemmingsplan een beleidstermijn van tien jaar. In het bestemmingsplan is daarom uitgegaan van de bouw van 1.500 woningen en de grootte van het plangebied is hierop afgestemd. Doel blijft echter wel om het totale plan van 1.800 woningen te ontwikkelen. Onderhavige onderzoek is daarom ook hierop afgestemd.

### 1.1 Situatiebeschrijving

Het voornemen is om aan de oostzijde van de A27, in de polder Hoef en Haag, een nieuw woongebied te realiseren inclusief enkele ondersteunende functies. Om deze planontwikkeling planologisch mogelijk te maken wordt een ruimtelijke procedure doorlopen. In onderstaande figuur is het ontwikkelingsgebied van de totale ontwikkeling en het plangebied uit het bestemmingsplan inclusief de directe omgeving globaal in beeld gebracht.

Figuur 1.1 Plangebied woongebied Hoef en Haag (bron ondergrond: Googlemaps, 2013)

 Ontwikkelingsgebied Hoef en Haag (1.800 woningen)

### 1.2 Leeswijzer

In dit rapport wordt in hoofdstuk 2 ingegaan op het wettelijk kader wat aan dit onderzoek ten grondslag ligt. Vervolgens zijn de in dit luchtkwaliteitonderzoek gehanteerde uitgangspunten in hoofdstuk 3 opgenomen, waarna de resultaten en de conclusie respectievelijk zijn opgenomen in hoofdstuk 4 en 5.

## 2 Wettelijk kader

De belangrijkste wet- en regelgeving voor luchtkwaliteit is vastgelegd in *Titel 5.2 Luchtkwaliteitseisen* van de Wet milieubeheer (Wm). In samenhang met Titel 5.2 zijn de grenswaarden voor luchtkwaliteit in bijlage 2 van de Wm opgenomen. In Titel 5.2 Wm is bepaald dat bestuursorganen een besluit, dat gevolgen kan hebben voor de luchtkwaliteit, kunnen nemen wanneer:

- wordt voldaan aan de in bijlage 2 Wm opgenomen grenswaarden;
- een besluit (per saldo) niet leidt tot een verslechtering van de luchtkwaliteit;
- aannemelijk is gemaakt dat een besluit 'niet in betekenisende mate' bijdraagt aan de concentratie van een stof;
- het project is opgenomen in het Nationaal Samenwerkingsprogramma Luchtkwaliteit (NSL).

Bij Titel 5.2 Wm horen uitvoeringsregels die zijn vastgelegd in Algemene Maatregelen van Bestuur (AMvB) en ministeriële regelingen. De volgende AMvB's en regelingen zijn of kunnen relevant zijn bij luchtkwaliteitonderzoeken:

- AMvB en Regeling niet in betekenisende mate bijdragen;
- Regeling projectsaldering 2007;
- Regeling beoordeling luchtkwaliteit 2007;
- Besluit Gevoelige bestemmingen.

In de *Regeling beoordeling luchtkwaliteit 2007* (Rbl2007) zijn regels vastgelegd voor de wijze van uitvoering van luchtkwaliteitonderzoeken. Bepaald is onder andere waar en hoe de luchtkwaliteit vastgesteld dient te worden. Tevens is vastgelegd dat gebruik gemaakt dient te worden van enkele generieke invoergegevens welke jaarlijks worden vastgesteld. Tot deze gegevens behoren onder andere de achtergrondconcentraties, de emissiefactoren voor het wegverkeer en de meteorologie.

### 2.1 Grenswaarden

De (Europese) grenswaarden voor de concentraties van luchtverontreinigende stoffen in de buitenlucht zijn vastgelegd in bijlage 2 van de Wet milieubeheer. Deze grenswaarden zijn gericht op de bescherming van de gezondheid van mensen en dienen op voorgeschreven data te zijn bereikt. In tabel 2.1 zijn de grenswaarden weergegeven.

Tabel 2.1: Grenswaarden

| Component                          | Concentratiesoort | Grenswaarden in $\mu\text{g}/\text{m}^3$ geldend op |              | Toegestane aantal overschrijdingen |
|------------------------------------|-------------------|---|--------------|------------------------------------|
|                                    |                   | < 01-01-2015  | > 01-01-2015 |                                    |
| Fijn stof ( $\text{PM}_{10}$ )     | jaargemiddelde    | 40  | 40           | -                                  |
|                                    | 24-uursgemiddelde | 50  | 50           | 35                                 |
| Fijn stof ( $\text{PM}_{2,5}$ )    | jaargemiddelde    | -   | 25           | -                                  |
| Stikstofdioxide ( $\text{NO}_2$ )  | jaargemiddelde    | 60  | 40           | -                                  |
|                                    | uurgemiddelde     | 300   | 200          | 18                                 |
| Koolmonoxide (CO)                  | 8-uurgemiddelde   | 10.000  | 10.000       | -                                  |
| Lood (Pb)                          | jaargemiddelde    | 0,5   | 0,5          | -                                  |
| Zwaveldioxide ( $\text{SO}_2$ )    | 24-uursgemiddelde | 125   | 125          | 3                                  |
|                                    | uurgemiddelde     | 350   | 350          | 24                                 |
| Benzeen ( $\text{C}_6\text{H}_6$ ) | jaargemiddelde    | 5   | 5            | -                                  |

Naast grenswaarden zijn er in bijlage 2 Wm voor de stoffen benzo(a)pyreen, ozon, arseen, cadmium en nikkel richtwaarden opgenomen. Richtwaarden geven een kwaliteitsniveau van de buitenlucht aan dat zo veel mogelijk moet zijn bereikt. De verwachting is dat de richtwaarden voor deze stoffen nergens in Nederland worden overschreden.

Voor de beoordeling van de luchtkwaliteit zijn stikstofdioxide ( $\text{NO}_2$ ) voor wat betreft het jaargemiddelde en fijn stof ( $\text{PM}_{10}$ ) voor wat betreft het jaar- en etmaalgemiddelde het meest kritisch. Hierbij is de kans het grootst dat deze grenswaarden worden overschreden. De grenswaarde voor de uurgemiddelde concentratie  $\text{NO}_2$  wordt in Nederland nergens meer overschreden. Uit metingen over de afgelopen 10 jaar blijkt dat overschrijding van de uurnorm voor  $\text{NO}_2$  niet meer aan de orde is<sup>1</sup>. Voor de overige stoffen waarvoor op dit moment voor de bescherming van de gezondheid van de mens grenswaarden gelden en die in bijlage 2 van de Wet milieubeheer zijn opgenomen (zwaveldioxide, lood, koolmonoxide en benzeen) is, voor zover relevant voor het wegverkeer, het verschil tussen de grenswaarde en de som van de bijdrage van het wegverkeer en de achtergrondconcentratie zo groot, dat overschrijding van de hiervoor geldende grenswaarden redelijkerwijs kan worden uitgesloten<sup>2</sup>.

Voor  $\text{PM}_{2,5}$  gaat vanaf 1 januari 2015 een grenswaarde gelden. In de Wet milieubeheer is bepaald dat daar op dit moment nog niet aan getoetst hoeft te worden, ook in het geval dat er na de genoemde datum gevolgen voor de luchtkwaliteit zijn. Gelet op de relatie tussen de concentraties  $\text{PM}_{10}$  en  $\text{PM}_{2,5}$ , kan, uitgaande van de huidige kennis over de emissies en concentraties  $\text{PM}_{2,5}$  en  $\text{PM}_{10}$ , worden gesteld dat als vanaf 2011 voldaan wordt aan de grenswaarden voor  $\text{PM}_{10}$  ook aan de grenswaarden voor  $\text{PM}_{2,5}$  zal worden voldaan<sup>3</sup>.

## 2.2 Besluit niet in betekenende mate bijdragen

In het *Besluit niet in betekenende mate bijdragen (luchtkwaliteitseisen)* (NIBM) is vastgelegd wanneer een project/plan niet in betekenende mate bijdraagt aan de concentratie van een bepaalde stof. Een plan/project draagt niet in betekenende mate bij als de toename van de concentraties in de buitenlucht van zowel  $\text{NO}_2$  als  $\text{PM}_{10}$  niet meer bedraagt dan 3% van de jaargemiddelde grenswaarde voor die stoffen. Dit komt voor beide stoffen overeen met een maximale toename van de concentraties met 1,2  $\mu\text{g}/\text{m}^3$ . Projecten die niet in betekenende mate bijdragen aan de verslechtering van de luchtkwaliteit hoeven niet getoetst te worden aan de grenswaarden uit de Wet milieubeheer. Wel moet worden aangetoond dat als gevolg van het project de jaargemiddelde concentraties  $\text{PM}_{10}$  en  $\text{NO}_2$  niet met meer dan 1,2  $\mu\text{g}/\text{m}^3$  toenemen.

In de onder het Besluit NIBM vallende *Regeling niet in betekenende mate bijdragen (luchtkwaliteitseisen)* is tot slot een aantal categorieën van plannen (projecten) opgenomen waarvoor tot een bepaalde omvang zonder meer geldt dat deze plannen niet in betekenende mate bijdragen. Blijft de ontwikkeling binnen de voor deze categorieën opgenomen grenzen, dan is het project per definitie niet in betekenende mate, hoeft dit niet met berekeningen te worden aangetoond en hoeft ook in dat geval verder geen toetsing aan de grenswaarden plaats te vinden.

Het *Besluit niet in betekenende mate bijdragen (luchtkwaliteitseisen)* is, per besluit van 7 juni 2012, gewijzigd. Deze wijziging maakt het mogelijk om in de Regeling NIBM gebieden en bronnen aan te wijzen die geen gebruik meer kunnen maken van NIBM.

## 2.3 Regeling beoordeling luchtkwaliteit 2007

In Titel 5.2 van de Wet milieubeheer en in de *Regeling beoordeling luchtkwaliteit 2007* (Rbl2007) zijn regels vastgelegd voor de wijze van uitvoering van luchtkwaliteitonderzoeken. Bepaald is onder andere waar en hoe de luchtkwaliteit vastgesteld dient te worden. Hier toe is vastgelegd met welke (standaard)rekenmethode gerekend moet worden. Hierbij wordt grofweg een verdeling gemaakt in wegen in stedelijk gebied (SRM1), buitenstedelijke wegen (SRM2) en industriële bronnen (SRM3).

### **Beoordelingslocaties**

Op welke plaatsen geen beoordeling van de luchtkwaliteit plaats hoeft te vinden is vastgelegd in Titel 5.2 van de Wet milieubeheer. Dit wordt beschreven in het zogenaamde toepasbaarheidsbeginsel. Er wordt niet getoetst op:

- locaties die zich bevinden in gebieden waartoe leden van het publiek geen toegang hebben en waar geen vaste bewoning is.
- terreinen waarop een of meer inrichtingen zijn gelegen, waar bepalingen betreffende gezondheid en veiligheid op arbeidsplaatsen van toepassing zijn. Het gaat hier om bedrijfsterreinen of terreinen van industriële inrichtingen waar ARBO-regels gelden.
- de rijbaan van wegen, en op de middenberm van wegen, tenzij voetgangers normaliter toegang hebben tot de middenberm.

Op locaties waar de luchtkwaliteit beoordeeld dient te worden, wordt deze beoordeeld op plaatsen waar significante blootstelling van mensen plaatsvindt. Hierbij wordt gekeken naar het zogenaamde blootstellingscriterium zoals dat is opgenomen in de Rbl2007. Het gaat om blootstelling gedurende een periode, die in vergelijking met de middelingstijd van de grenswaarde (jaar, etmaal, uur) significant is. Dit betekent dat op een plaats waar een burger langdurig wordt blootgesteld, getoetst moet worden aan de jaargemiddelde grenswaarden (onder meer bij woningen).

Bij wegen dient de beoordeling plaats te vinden op maximaal 10 meter van de wegrand. Indien de rooilijn van de naastgelegen bebouwing binnen deze 10 meter is gelegen dient de afstand tot de bebouwing aangehouden te worden. Het gekozen beoordelingspunt dient representatief te zijn voor een wegdeel van ten minste 100 meter lengte. Voor inrichtingen wordt beoordeeld vanaf de grens van de inrichting.

### **Zeezoutcorrectie**

Concentraties van zwevende deeltjes (fijn stof/PM<sub>10</sub>) die zich van nature in de lucht bevinden en niet schadelijk zijn voor de gezondheid van de mens mogen, indien de berekende concentratie hoger is dan de geldende grenswaarde, buiten beschouwing worden gelaten. Welke correctie mag worden toegepast is afhankelijk van de locatie.

## 3 Uitgangspunten voor het onderzoek

### 3.1 Situatiebeschrijving

Ten oosten van de kern Vianen, in de oksel van de Lek en de A27, worden door middel van een nieuw bestemmingsplan circa 1.800 nieuwe woningen en diverse nieuwe voorzieningen mogelijk gemaakt. Het gaat daarbij om voorzieningen ten behoeve van het onderwijs, zorg en welzijn en detailhandel.

Figuur 3.1: Proefverkaveling Masterplan Hoef en Haag Vianen (SVP & Haver Droeze, 2012)

Het plangebied wordt ontsloten via een nieuwe ontsluitingsweg op de Hagenweg/ aansluiting A27 aan de noordzijde en een ontsluiting op de Lange Dreef aan de zuidzijde. Deze twee aansluitingen worden verbonden door de nieuw te realiseren Berchmansweg die tevens onderdeel is van het ruimtelijk plan. In het plangebied zelf wordt een interne ontsluitingsstructuur aangelegd voor de afwikkeling van het verkeer dat naar de verschillende functies in het gebied gaat rijden.

### 3.2 Onderzochte situaties

Ten behoeve van de ruimtelijke planprocedure zijn berekeningen uitgevoerd voor de beoordelingsjaren 2014 en 2024. Het jaar 2014 is het verwachte jaar van definitieve besluitvorming over het ruimtelijk plan en is tevens het eerste jaar waarin effecten kunnen worden verwacht. Het beoordelingsjaar 2024 geeft een doorblik naar de toekomst (conform de geldigheidsduur van het bestemmingsplan).

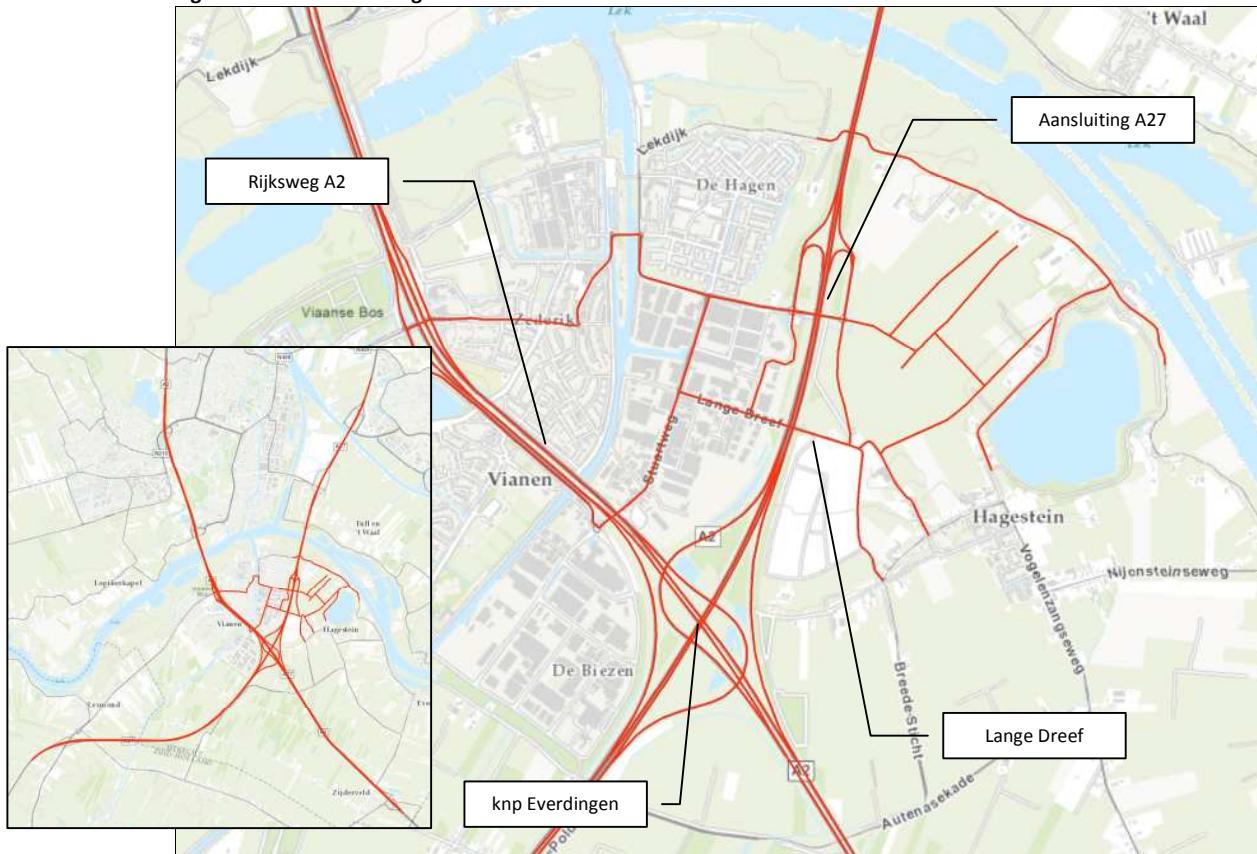

In de genoemde beoordelingsjaren is zowel de referentiesituatie als de plansituatie onderzocht en in beeld gebracht waarbij voor de plansituatie uitgegaan is van volledige ontwikkeling in beide jaren. Dit betekent dat al in 2014 gerekend is met de volledige verkeersgeneratie van de nieuwe functies in het gebied. Gezien de nog te doorlopen procedures en de benodigde bouwtijd mag duidelijk zijn dat het plan in 2014 nog niet volledig is gerealiseerd. Voor het beoordelingsjaar 2014 leidt deze werkwijze dan ook tot een overschatting van de daadwerkelijke concentraties in de omgeving. De nu gehanteerde werkwijze is voor dat jaar dan ook als worst case te beschouwen. Hetzelfde geldt voor de plansituatie 2024, daar het bestemmingsplan in deze periode maximaal 1.500 woningen mogelijk maakt.

### 3.3 Selectie wegvakken

Door de ontwikkeling van nieuwe woningen en overigens voorzieningen in het plangebied gaat er meer verkeer rijden op de wegen in de (directe) omgeving van het plangebied. Daarnaast zal er binnen het plangebied sprake zijn van intern verkeer dat naar de te realiseren voorzieningen gaat rijden.

In dit luchtkwaliteitonderzoek zijn alle wegen meegenomen waarop sprake is van een relevante wijziging van het verkeer. Het gaat daarbij hoofdzakelijk om de directe ontsluitingswegen van het plan, de wegen in het plangebied en de nieuw aan te leggen Berchmansweg. In figuur 3.2 zijn de in dit onderzoek betrokken wegvakken weergegeven.

**Figuur 3.2: Betrokken wegvakken**

### 3.4 Verkeersgegevens

De verkeersgegevens voor de onderzochte situaties zijn verkregen uit het verkeersonderzoek dat in het kader van de ruimtelijke planprocedure is uitgevoerd. Daarbij is gebruik gemaakt van een verkeersmodel waarin onder andere rekening is gehouden met de nieuw te realiseren woningen en voorzieningen in het plangebied Hoef en Haag, alsmede met de aanleg van de Berchmansweg. In tabel 3.1 zijn de gehanteerde etmaalintensiteiten weergegeven voor enkele relevante wegvakken.

Tabel 3.1: Gehanteerde etmaalintensiteiten [mvt/etmaal, weekdaggemiddelden]

| Wegvak   | 2014 ref. | 2014 plan | 2024 ref. | 2024 plan |
|--|-----------|-----------|-----------|-----------|
| Ontsluitingsweg plangebied naar aansluiting A27                  | 0         | 8.644     | 0         | 8.593     |
| Lange Dreef ter hoogte van de onderdoorgang A27                  | 4.666     | 3.516     | 6.967     | 4.578     |
| Berchmansweg   | 0         | 4.525     | 0         | 5.817     |
| Stuartweg nabij de aansluiting met de Hagenweg                   | 8.167     | 7.723     | 8.580     | 8.029     |
| Ingenieurs D.S. Tuijnmanweg nabij de aansluiting met de Hagenweg | 4.711     | 3.741     | 6.502     | 4.509     |
| A27 tussen knp Everdingen en aansl. Vianen (oostbaan)            | 51.403    | 51.800    | 61.030    | 61.569    |
| A27 tussen knp Everdingen en aansl. Vianen (westbaan)            | 49.214    | 49.675    | 60.275    | 60.862    |

In het rekenmodel zijn ook de rijkswegen A2 en A27 opgenomen. Omdat de bijdrage van deze rijkswegen ook al meegenomen is in de grootschalige achtergrondconcentraties is sprake van een dubbeltelling. Om deze dubbeltelling te voorkomen is de dubbeltellingcorrectie toegepast zoals deze is vastgesteld door het ministerie van Infrastructuur en Milieu. Omwille van een correcte werking van de dubbeltellingcorrectie is rekening gehouden met de bijdrage van het verkeer op de rondom het plangebied gelegen snelwegen tot op ten minste drie kilometer afstand van de beoordelingspunten. Aangezien op enkele delen van de A27 en A2 sprake kan zijn van stagnatie, is in de berekening voor de ochtend- en avondspits rekening gehouden met deze stagnatie. Voor de mate van stagnatie is aansluiting gezocht bij de gegevens die zijn opgenomen in de NSL Monitoringstool<sup>4</sup>.

### 3.5 Rekenprogramma en weg- en omgevingskenmerken

De berekeningen van de concentraties luchtverontreinigde stoffen in de lucht zijn uitgevoerd met de module STACKS in het programma Geomilieu (versie 2.21). Het rekengedeelte van dit programma is STACKS+, een door het ministerie van Infrastructuur en Milieu gevalideerd rekenprogramma. De in Geomilieu geïntegreerde module STACKS is een uitbreiding van het reeds bestaande STACKS+ met een geo-module welke is ontwikkeld ten behoeve van de invoer van bronnen en relevante gegevens.

Het programma is in staat om de bijdragen van de verschillende bronsoorten met de bijbehorende standaardrekenmethoden in één berekening te combineren waardoor het bij uitstek geschikt is voor onderzoeken nabij buitenstedelijke (snel)wegen (SRM2) en wegen waarlangs bebouwing is gelegen (SRM1). De per bronsoort berekende bijdragen aan de concentraties van stoffen worden op een beoordelingspunt automatisch bij elkaar opgeteld weergegeven, zodat een volledige toets aan de grenswaarden kan plaatsvinden.

#### Weg- en omgevingskenmerken

Naast de verkeersgegevens dienen ook nog enkele andere gegevens te worden ingevoerd. Tot deze gegevens behoren onder meer weg- en omgevingskenmerken als snelheid en de mate van bebouwing.

In dit onderzoek zijn de wegen die vallen onder het toepassingsbereik van standaardrekenmethode 2 (SRM2) gemodelleerd als het wegtype 'snelweg' of 'normaal'. Aangezien voor delen van de snelwegen sprake is van verhoogde ligging ten opzichte van het omliggende maaiveld is voor die wegvakken in het model gerekend met een weghoogte. Er is eveneens rekening gehouden met de langs de snelwegen gelegen schermen of wallen. Voor deze SRM2-wegen is de maximumsnelheid als rijsnelheid in het rekenmodel gehanteerd.

<sup>4</sup> Met behulp van de NSL Monitoringstool wordt de luchtkwaliteit in Nederland jaarlijks beoordeeld en worden indien nodig aanvullende maatregelen genomen. In de berekeningen wordt gebruik gemaakt van de jaarlijks vastgestelde generieke invoergegevens en de verkeersgegevens van de verantwoordelijk wegbeheerder.

Voor de wegen waarlangs min of meer aaneengesloten bebouwing is gelegen en die vallen binnen het toepassingsbereik van standaardrekenmethode 1 (SRM1) is gerekend met het wegtype 'canyon'. Bij deze wegen zijn de bijbehorende omgevingskenmerken als hoogte van de naastgelegen bebouwing, de afstand tot deze bebouwing en de mate van openheid ingevoerd (ventilatiefactor). Voor de snelheden is een gemiddelde rijsnelheid gehanteerd die overeenkomt met de snelheidstyperingen zoals die in het SRM1-rekenprogramma CARI worden gebruikt. In deze snelheden is het stop- en rijgedrag van de motorvoertuigen meegenomen waardoor sprake is van een lagere snelheid dan de wettelijk toegestane maximumsnelheid.

Langs een groot deel van de wegen in het plangebied worden nieuwe woningen of voorzieningen gerealiseerd. Om deze bebouwing te simuleren is voor alle wegen in het plangebied uitgegaan van het wegtype 'canyon'. Daarbij is uitgegaan van een relatief smalle canyon, een gemiddelde gebouwhoogte van 9 meter aan beide zijden van de weg. Dit is een voor luchtkwaliteit ongunstige modellering.

Alle gehanteerde invoergegevens zijn opgenomen in bijlage 1.

#### Overige invoergegevens

Naast de weg- en omgevingskenmerken en verkeersgegevens dienen in het rekenprogramma Geomilieu nog een aantal algemene invoerparameters te worden ingevoerd. Het gaat daarbij onder meer om de meteorologische rekenperiode en de gehanteerde ruwheidslengte. In tabel 3.2 zijn de gehanteerde rekenparameters opgenomen.

**Tabel 3.2: Algemene invoergegevens Geomilieu**

| Parameter  | Gehanteerde invoer                                  |
|--|---|
| Referentiejaar NO <sub>2</sub> en PM <sub>10</sub> | 2014, 2024  |
| GCN referentiepunt                                 | Mid bronnen   |
| Rekenperiode                                       | 1995 - 2004   |
| Weekendverkeersverdeling                           | 1 (weekdaggemiddelen)                               |
| Zeezoutcorrectie                                   | 0 µg/m <sup>3</sup>                                 |
| Ruwheidslengte z0                                  | 0,32 (conform PreSRM, gebaseerd op het modelgebied) |

### 3.6 Wijze van beoordeling

De concentraties luchtverontreinigende stoffen zijn berekend langs de in dit onderzoek betrokken wegvakken. Voor de lokale wegen is de beoordeling, conform de Regeling beoordeling luchtkwaliteit 2007, uitgevoerd op maximaal 10 meter uit de wegrand. Aannemelijk is dat als op 10 meter uit de wegrand wordt voldaan aan de grenswaarden, ook op grotere afstand van de weg wordt voldaan aan de grenswaarden.

Voor de beoordelingspunten langs de rijkswegen A2 en A27 is aansluiting gezocht bij de NSL toetspunten langs het rijkswegennet zoals opgenomen in de NSL Monitoringstool voor het NSL jaar 2015. In de NSL Monitoringstool is voor deze beoordelingspunten rekening gehouden met het toepasbaarheidsbeginsel en/of blootstellingscriterium zoals dat is vastgelegd in de wet- en regelgeving voor luchtkwaliteit.

In bijlage 2 is een overzicht opgenomen van de voor de berekeningen gehanteerde beoordelingspunten.

### 3.7 Doorgaande scheepvaart in de omgeving

In de directe omgeving van het plangebied zijn de Lek, het Lekkanaal en het Merwedekanaal gelegen. De doorgaande beroepsvaart op deze vaarwegen is van invloed op de concentraties luchtverontreinigende stoffen ter plaatse van de gehanteerde beoordelingspunten. Om deze reden is de doorgaande beroepsvaart meegenomen in de berekeningen. Daarbij dient wel opgemerkt te worden dat de bijdrage van de scheepvaart ook al is meegenomen in de grootschalige achtergrondconcentraties. Doordat de scheepvaart ook specifiek meegenomen is in de berekeningen kan sprake zijn van een lichte dubbeltelling waardoor sprake kan zijn van een overschatting van de daadwerkelijke concentraties.

Voor de scheepvaartintensiteiten, de onderverdeling naar verschillende scheepstypen en de verhouding beladen/onbeladen is aansluiting gezocht bij de informatie die beschikbaar is voor de verschillende sluizen in de genoemde vaarwegen<sup>5</sup>. Het gaat daarbij om de sluis bij Hagestein in de Lek ten oosten van het Lekkanaal, de Prinses Beatrixsluis in het Lekkanaal en de sluis in het Merwedekanaal bij Vianen. Voor de Lek ten westen van het Lekkanaal is uitgegaan van de som van het scheepvaartverkeer op de Lek (ter hoogte van sluis Hagestein) en het Lekkanaal. Op basis van deze informatie zijn de emissies NO<sub>x</sub> en PM<sub>10</sub> en de warmte-output bepaald met behulp van de rekenapplicatie PRELUDE<sup>6</sup>.

De berekende emissies voor het doorgaande scheepvaartverkeer zijn in het rekenmodel meegenomen door de vaarlijnen te simuleren met een lijn van puntbronnen, waarbij de emissies voor het gehele vaarwegvak gelijkmatig over de puntbronnen zijn verdeeld. Voor alle schepen is gerekend met een gemiddelde bronhoogte van 2,3 meter, de warmte-output die door PRELUDE is bepaald en is gerekend met een zeer lage uitstroomsnelheid.

Ter plaatse van de sluizen is sprake van een afwijkende emissie ten opzichte van het varende verkeer. Het gaat daarbij onder andere om het in- en uitvaren van de sluis en het schutten. Ook de emissies ter plaatse van de sluis Hagenstein, de sluis bij Vianen en de Prinses Beatrixsluis zijn om die reden apart meegenomen in de berekeningen. Voor de bepaling van de emissies en warmte-output is eveneens gebruik gemaakt van PRELUDE en een maximale schuttijd van 30 minuten.

<sup>5</sup> Rijkswaterstaat Dienst Verkeer en Scheepvaart, *Scheepvaartinformatie Hoofdvaarwegen*, editie 2009, augustus 2009

<sup>6</sup> De applicatie PRELUDE is in opdracht van het voormalige ministerie van VROM ontwikkeld om emissiekentallen te bepalen voor de binnenvaart. In PRELUDE wordt onder andere rekening gehouden met het type vaarweg, het aantal schepen per klasse en de verhouding beladen/onbeladen.

## 4 Resultaten en beoordeling

In dit hoofdstuk zijn de berekende concentraties stikstofdioxide ( $\text{NO}_2$ ) en fijn stof ( $\text{PM}_{10}$ ) weergegeven en beoordeeld. Alle berekeningsresultaten zijn opgenomen in bijlage 3. Voor een beoordeling van de overige luchtverontreinigende stoffen waarvoor in de Wet milieubeheer grenswaarden zijn opgenomen wordt verwezen naar hoofdstuk 2.

### 4.1 Referentiesituatie

In tabel 4.1 zijn de hoogst berekende concentraties stikstofdioxide ( $\text{NO}_2$ ) en fijn stof ( $\text{PM}_{10}$ ) weergegeven in de referentiesituatie, zowel voor 2014 als voor 2024.

Tabel 4.1: Hoogst berekende resultaten referentiesituatie

|   | 2014 | 2024 | Grenswaarde |
|---|------|------|-------------|
| Jaargemiddelde $\text{NO}_2$                              | 39,7 | 26,7 | 40*         |
| Jaargemiddelde $\text{PM}_{10}$                           | 26,6 | 24,0 | 40          |
| Aantal overschrijdingen etmaalgemiddelde $\text{PM}_{10}$ | 20   | 15   | 35          |

\* tot 2015 is een grenswaarde van kracht van  $60 \mu\text{g}/\text{m}^3$

Uit de tabel blijkt dat de grenswaarden voor  $\text{NO}_2$  als voor  $\text{PM}_{10}$  in de referentiesituatie niet worden overschreden. De hoogste jaargemiddelde concentraties zijn berekend langs de A2 (tussen knooppunt Everdingen en de brug over het Merwedekanaal). Ter plaatse van de overige beoordelingspunten variëren de berekende jaargemiddelde concentraties  $\text{NO}_2$  in 2014 tussen de  $22,7 \mu\text{g}/\text{m}^3$  en de  $39,7 \mu\text{g}/\text{m}^3$ . Voor  $\text{PM}_{10}$  variëren de berekende jaargemiddelde concentraties in 2014 tussen de  $23,9 \mu\text{g}/\text{m}^3$  en de  $26,6 \mu\text{g}/\text{m}^3$  (exclusief de correctie voor zeezout).

### 4.2 Plansituatie

In tabel 4.2 zijn de hoogst berekende concentraties stikstofdioxide ( $\text{NO}_2$ ) en fijn stof ( $\text{PM}_{10}$ ) weergegeven in de plansituatie, zowel voor 2014 als voor 2024. In beide jaren is voor de plansituatie uitgegaan van volledige ontwikkeling van het plan Hoef en Haag.

Tabel 4.2: Hoogst berekende resultaten plansituatie

|   | 2014 | 2024 | Grenswaarde |
|---|------|------|-------------|
| Jaargemiddelde $\text{NO}_2$                              | 39,8 | 26,8 | 40*         |
| Jaargemiddelde $\text{PM}_{10}$                           | 26,6 | 24,0 | 40          |
| Aantal overschrijdingen etmaalgemiddelde $\text{PM}_{10}$ | 20   | 15   | 35          |

\* tot 2015 is een grenswaarde van kracht van  $60 \mu\text{g}/\text{m}^3$

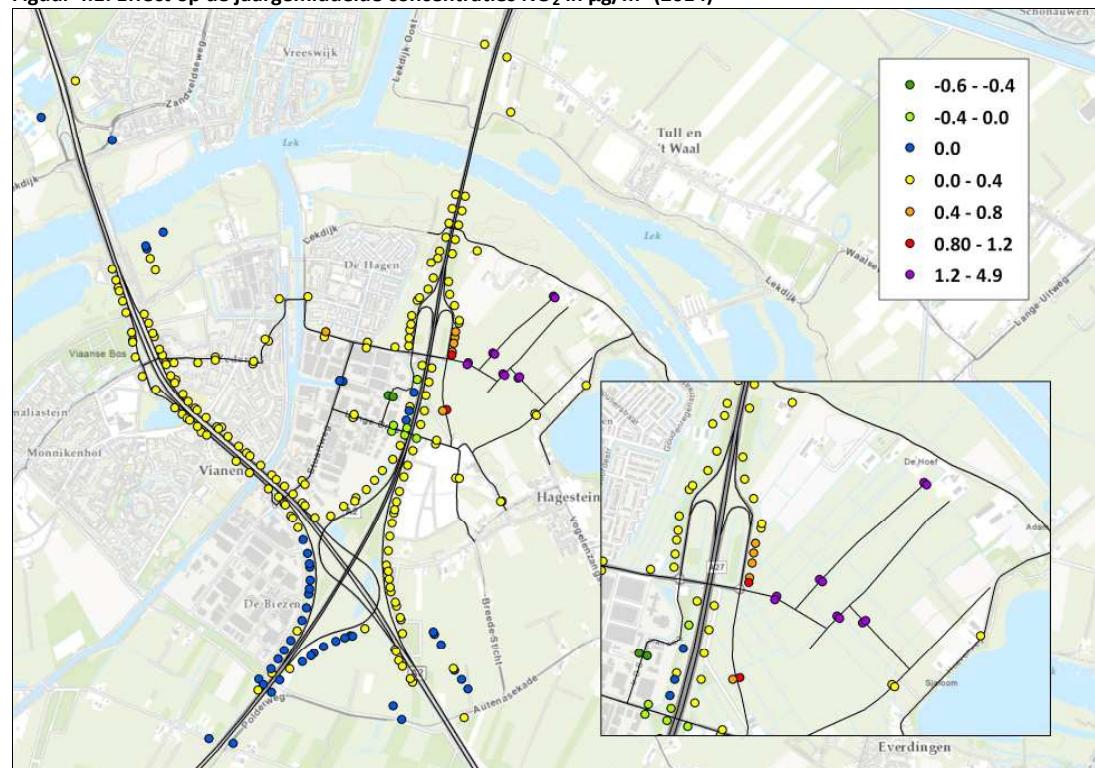

De hoogste jaargemiddelde concentraties zijn, net als in de referentiesituatie, berekend langs de A2 (tussen knooppunt Everdingen en de brug over het Merwedekanaal). Het planeffect is op deze locatie echter klein waardoor de hoogst berekende concentraties in de referentie- en de plansituatie (vrijwel) gelijk zijn. De planeffecten zijn ter plaatse van een groot aantal andere beoordelingspunten een stuk groter, de absolute concentraties  $\text{NO}_2$  en  $\text{PM}_{10}$  zijn op die locaties echter lager dan de in de tabel gepresenteerde hoogste rekenresultaten. Ter plaatse van de overige beoordelingspunten variëren de berekende jaargemiddelde concentraties  $\text{NO}_2$  in 2014 tussen de  $23,6 \mu\text{g}/\text{m}^3$  en de  $39,8 \mu\text{g}/\text{m}^3$ . Voor  $\text{PM}_{10}$  variëren de berekende jaargemiddelde concentraties in 2014 tussen de  $23,9 \mu\text{g}/\text{m}^3$  en de  $26,6 \mu\text{g}/\text{m}^3$  (exclusief de correctie voor zeezout).

Op basis van voorgaande kan geconcludeerd worden dat de grenswaarden voor  $\text{NO}_2$  en  $\text{PM}_{10}$  in de plansituatie niet worden overschreden. Voor  $\text{NO}_2$  wordt reeds in 2014 voldaan aan de strengere grenswaarde voor deze stof die vanaf 2015 van kracht wordt, in 2015 zal om die reden ook aan deze grenswaarde worden voldaan.

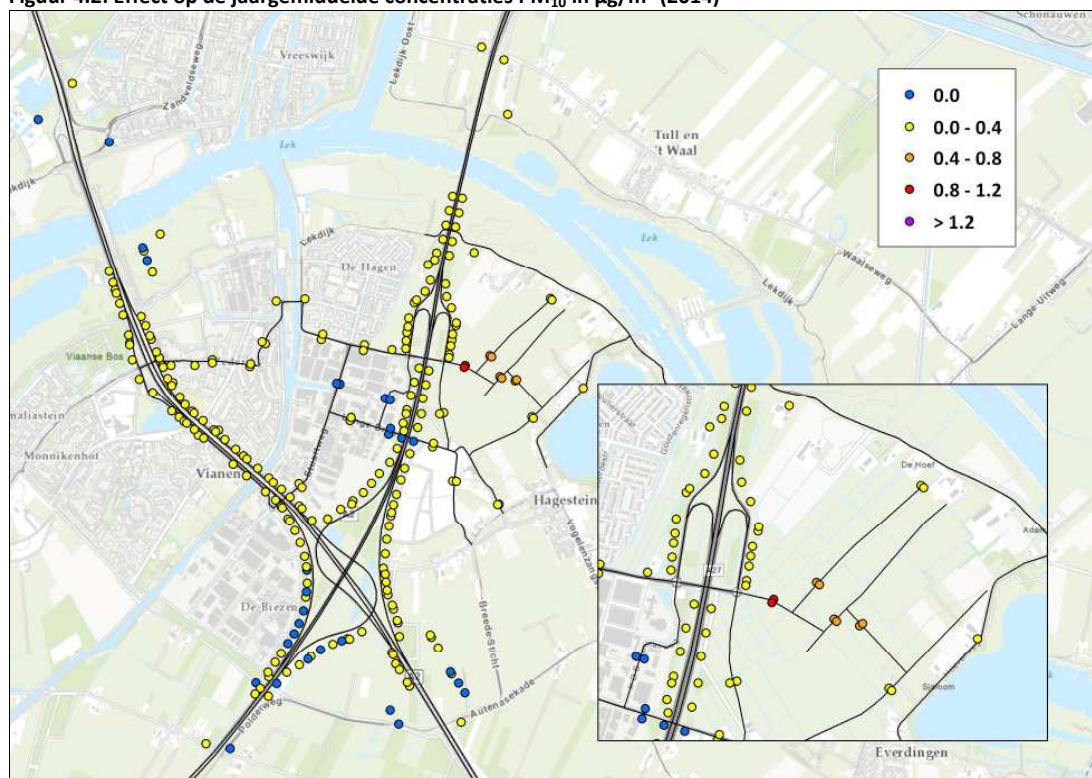

### 4.3 Effectbeschrijving

Om de effecten van het voorgenomen plan in beeld te brengen is een vergelijking gemaakt tussen de berekende concentraties in de referentie- en de plansituatie. In figuur 4.1 en 4.2 zijn de verschillen in de jaargemiddelde concentraties NO<sub>2</sub> en PM<sub>10</sub> weergegeven.

Figuur 4.1: Effect op de jaargemiddelde concentraties NO<sub>2</sub> in µg/m<sup>3</sup> (2014)

Figuur 4.2: Effect op de jaargemiddelde concentraties PM<sub>10</sub> in µg/m<sup>3</sup> (2014)

Uit de figuur blijkt dat de grootste toenamen zijn berekend in het plangebied zelf, dit geldt zowel voor NO<sub>2</sub> als voor PM<sub>10</sub>. Dit komt voornamelijk omdat de wegen in het plangebied momenteel nog niet aanwezig zijn en daar dus nog geen (gemotoriseerd) verkeer rijdt.

Langs de bestaande wegen in de omgeving van het plangebied zijn de berekende toenamen het grootste langs de directe ontsluitingswegen. Naarmate de afstand tot het plangebied groter wordt nemen de toenamen af. Het plan draagt op het overgrote deel van het plangebied 'niet in betekenende mate (NIBM)' bij aan de jaargemiddelde concentraties NO<sub>2</sub> (< 1,2 µg/m<sup>3</sup>). Voor PM<sub>10</sub> draagt het plan op geen van de punten meer dan 1,2 µg/m<sup>3</sup> bij. Zoals weergegeven in de figuur is langs enkele van de onderzochte wegen sprake van een afname van de berekende concentraties. Dit wordt veroorzaakt door de afname van verkeer op deze wegen als gevolg van de aanleg van de Berchmansweg (welke onderdeel is van het voorgenomen plan).

#### 4.4 Beoordeling concentraties in het plangebied

In het kader van een goede ruimtelijke ordening is specifiek gekeken naar de berekende concentraties luchtverontreinigende stoffen in het plangebied. Hiervoor is gebruik gemaakt van de concentraties langs de nieuw aan te leggen wegen in of direct rondom het plangebied (beoordelingspunten 3-8 en 56-59). De maximale jaargemiddelde concentratie NO<sub>2</sub> bedraagt op deze beoordelingspunten 26,6 µg/m<sup>3</sup>, de maximale jaargemiddelde concentratie PM<sub>10</sub> bedraagt 24,8 µg/m<sup>3</sup>. Aangezien deze hoogst berekende jaargemiddelde concentraties in het plangebied ruim onder de vastgestelde grenswaarden liggen kan worden geconcludeerd dat ter plaatse van de te ontwikkelen functies in het plangebied (waaronder woningen) ruimschoots wordt voldaan aan de luchtkwaliteitseisen.

## 5 Conclusie

In het kader van de ruimtelijke procedure voor het plan Hoef en Haag in Vianen is een onderzoek uitgevoerd naar de concentraties luchtverontreinigende stoffen. Daarbij zijn de concentraties stikstofdioxide ( $\text{NO}_2$ ) en fijn stof ( $\text{PM}_{10}$ ) uitgerekend op een groot aantal beoordelingspunten langs de in het onderzoek betrokken wegvakken.

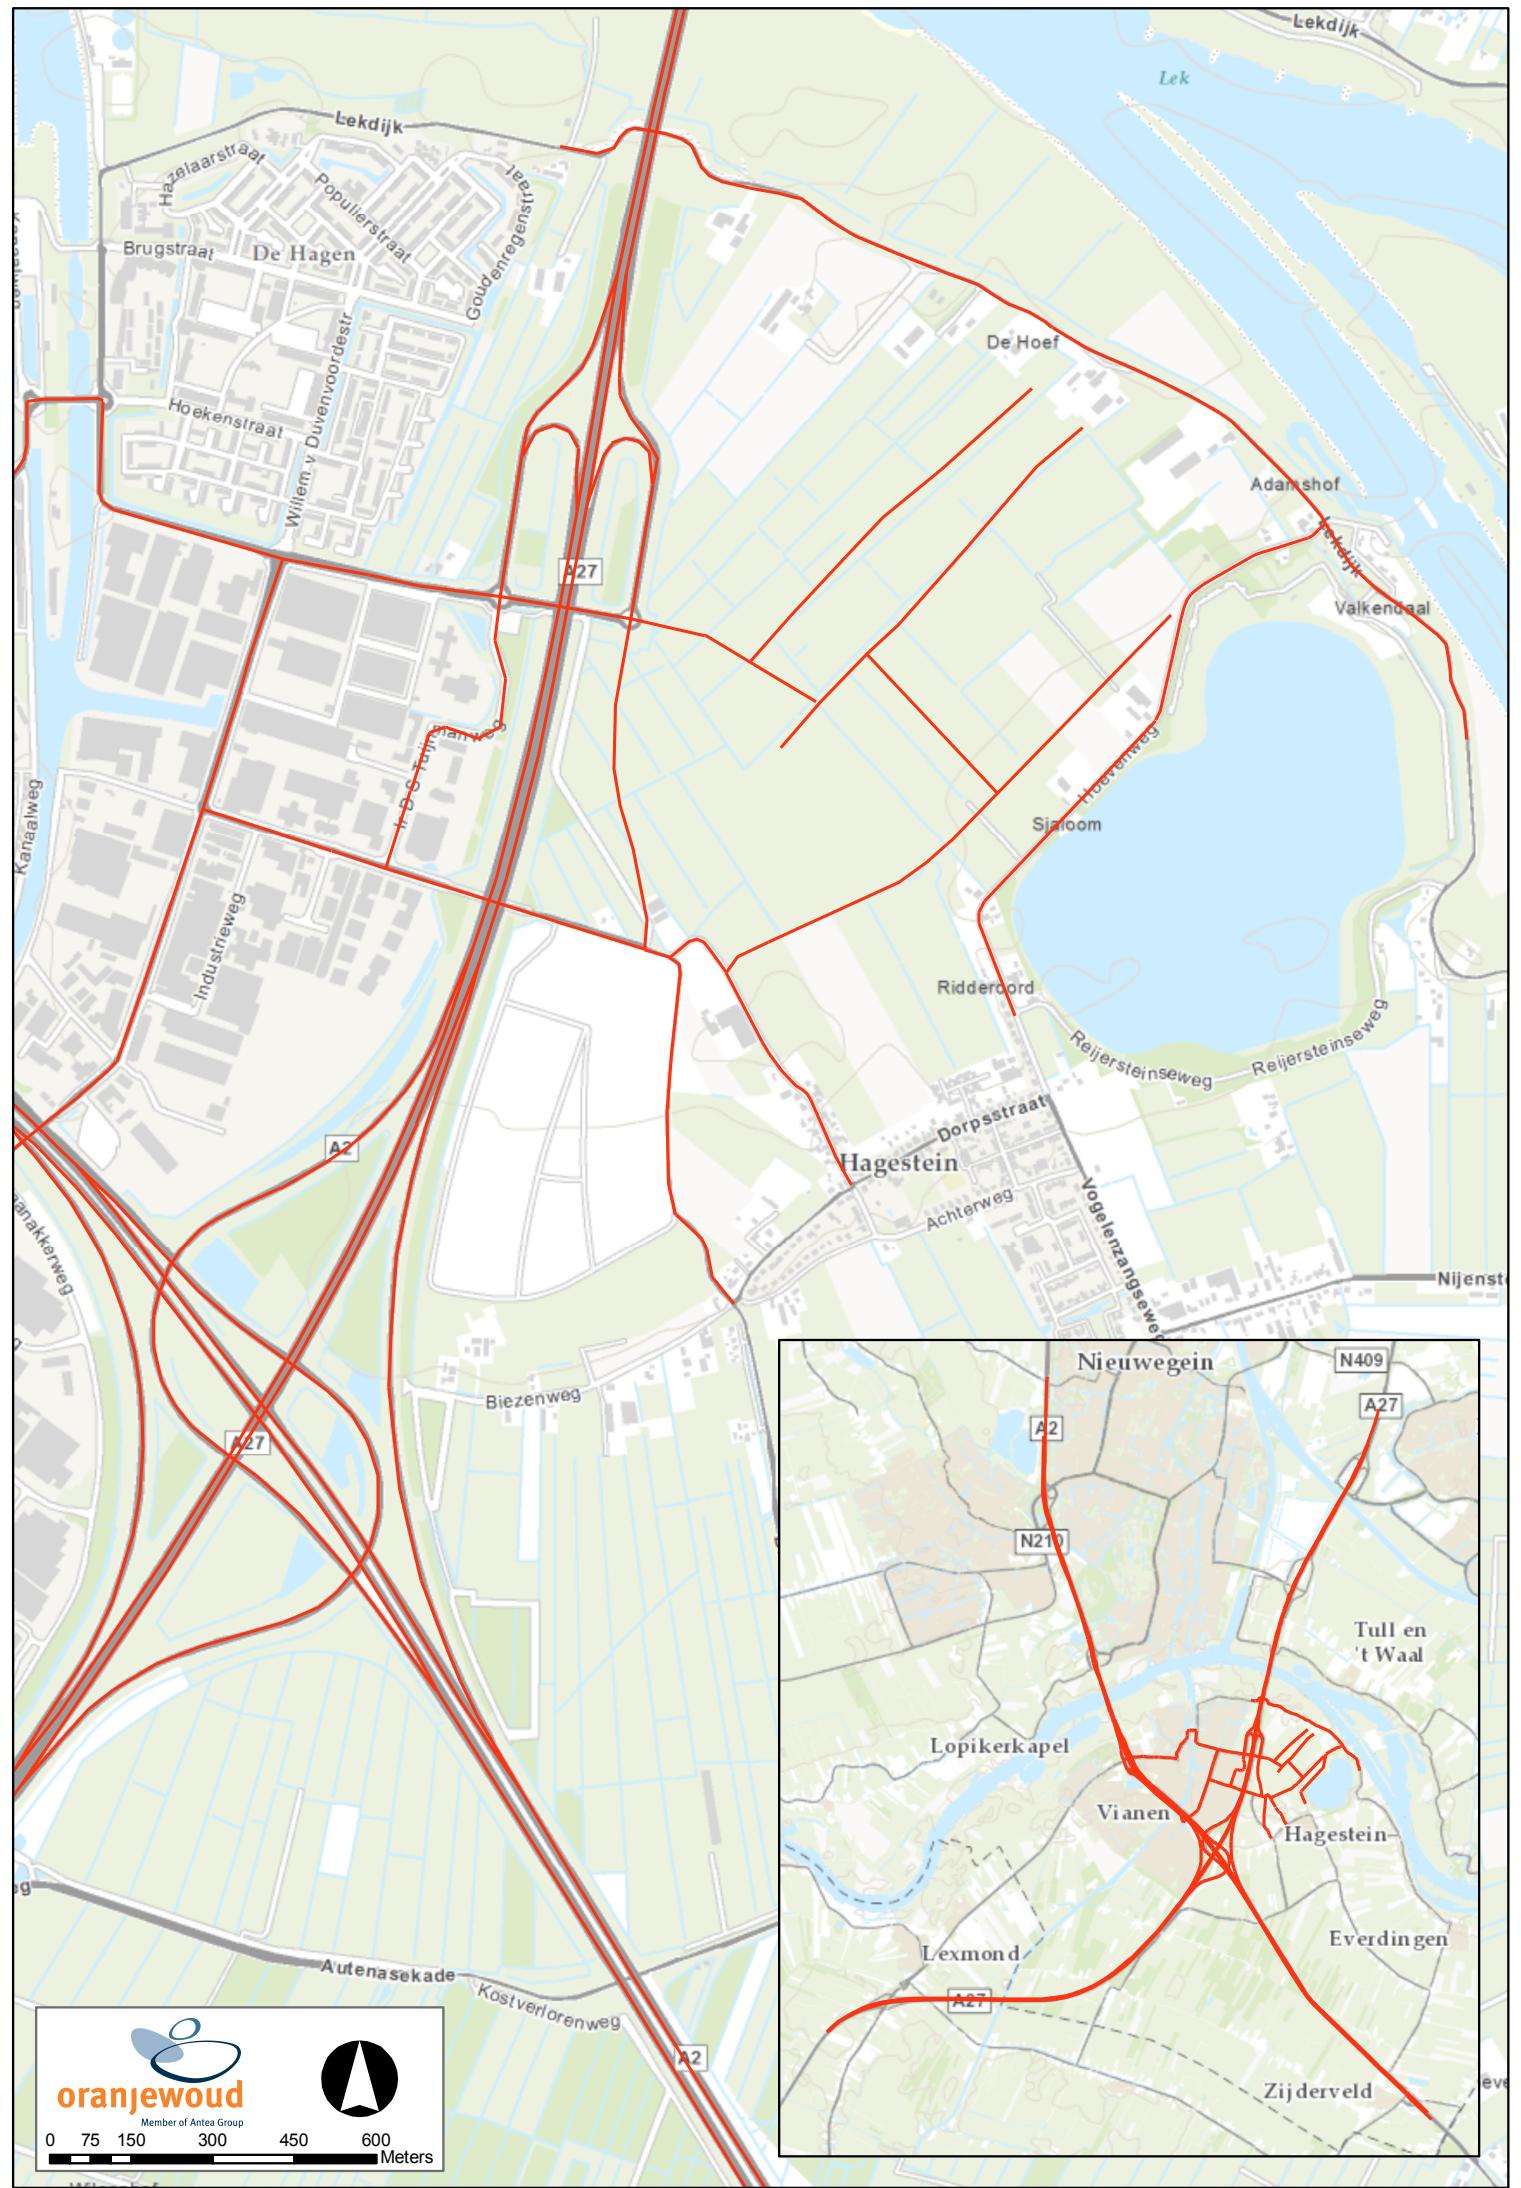

Op basis van dit luchtkwaliteitonderzoek kan worden geconcludeerd dat op alle beoordelingspunten wordt voldaan aan de grenswaarden zoals opgenomen in bijlage 2 van de Wet milieubeheer. Derhalve kan worden geconcludeerd dat Titel 5.2 van de Wet milieubeheer geen belemmering vormt voor verdere besluitvorming.
